(NB! punktid 2.1- 2.6 täidab struktuuriüksus)

Punktid 2.1 ja 2.2.

Semiconductor Electronics (BaseLab MINAKO, including the Chair Electronics Design)

Theoretical and experimental study of wide and semi-wide bandgap materials based semiconductor devices; design and fabrication of improved semiconductor components using non-traditional technologies (e.g. DWT) and numerical characterization; Semiconductor components and nanostructures meeting specific ambient and operating requirements; specific investigations (DLTS spectroscopy, numerical experiments) of electro-physical parameters (deep levels and their influence on electrical characteristics) in semiconductor structures.

Most important results:

- Detection of the new phenomena in semiconductor (SiC, GaAs) structures by the aid of Deep Level Transient Spectroscopy (DLTS) – creation of trap clusters for charge carriers under the diffusion welded contacts, which have strong and specific influence on electrical characteristics and speed parameters of GaAs and SiC based devices. In addition, we formulated the conditions for diffusion welding technology to be used for obtaining polytypic heterostructures in SiC, which widen the horizons for developing of high performance sensing and energy conversion devices.

System Electronics, bionics and Signal processing (Baselab SIE, including Chair of Applied Electronics and Chair of the Sensor Signals Processing)

Design of new signal processing methods and tools for smart instruments; precision circuits and systems (impedance spectroscopy, chirp-signals, etc.); test and measurement methods for diagnostics and medical diagnosis; fabrication methods for microfluidic lab-on-chips and signal processing solutions for analysing of micro-droplets; new impedance measurement based solutions for improvement of energy consumption in portable mobile devices.

Most important results:

- Novel principles for synthesis, generation and processing of signals used for identification and diagnosing of objects (biological and physiological, chemical and electrochemical, electrically conducting and semi-conducting etc. materials, structures, organs, devices and systems) with the aim to obtain the required information more faster and precisely. The signal processing covers short-time frequency domain methods, implemented for the measurement of transfer functions of the objects performing the broad-band spectroscopy (e.g., impedance spectroscopy) using the designed task specific processors.
